- (54) Use of a fat composition in frying.
- The present invention is concerned with the use of a fat composition comprising at least 60 wt.% fat in frying foodstuffs, wherein the fat essentially consists of a mixture of one or more non-digestible polyol fatty acid polyesters and optionally triglyceride fat, the mixture of polyol fatty acid polyesters containing less than 12% unsaturated fatty acid residues and having a slip melting point of less than 50°C.

The use of the above fat composition in frying foodstuffs offers the advantage, as compared with the use of polyol fatty acid polyester containing compositions known in the art, that only limited polymerization is observed and, due to the relatively low slip melting point, a better mouthfeel is obtained.
